Storyboard: Who powers France?

Story: electricity is produced and consumed locally. A few French regions power the others, and a green mix does not mean self-sufficiency.

Audience: citizens, students and regional decision makers.

Questions

1. Which regions produce more electricity than they consume?
2. How green is each regional mix, and how did it change?
3. What would change if a region built more solar or wind?

Flow

Step	Message	Visual
Hook	France exports low-carbon power, but regions are very different.	Text, questions
Key numbers	Where the selected regions stand, and the change over time.	4 KPIs
Overview	The mix changes over time; nuclear dominates, renewables grow.	Line chart, stacked bars
Compare regions	Only a few regions produce more than they consume.	Map, ranking, scatter, small multiples
What if	The same increase has very different effects by region.	Sliders, scenario bars
Data quality	The data is reliable for monthly comparisons; limits are stated.	Checks table, heatmap
Insights	Cleaner mix; a few regions power the others; green share is not autonomy.	3 takeaways, next steps

Sidebar filters (regions, period, indicator) update the KPIs, the charts and the scenario.
